...

However easy it is to disprove conjectures, a method to prove conjectures is still required. The most common method for proving conjectures is direct proof. This method will be used to prove the lattice problem above. Prove that the number of segments connecting an  $n \times n$  lattice is  $2n(n+1)$ .

A pair of mathematicians has solved the first chunk of one of the most famous conjectures about the additive properties of whole numbers. Proposed more than 60 years ago by the legendary Hungarian mathematician Paul Erdős, the conjecture asks when an infinite list of whole numbers will be sure to contain patterns of at least three evenly spaced numbers, such as 26, 29 and 32.

Thomas Callister Hales (born June 4, 1958) is an American mathematician working in the areas of representation theory, discrete geometry, and formal verification. In representation theory he is known for his work on the Langlands program and the proof of the fundamental lemma over the group  $Sp(4)$  (many of his ideas were incorporated into the final proof, due to Ngô Bảo Châu).

## **Thomas Callister Hales - Wikipedia**

To eliminate any uncertainties about the correctness of the proof, Hales launched the Flyspeck project in the beginning of 2003. The aim of this project is a complete formal verification of the Kepler conjecture. In my talk, I will give a high level overview of the proof of the Kepler conjecture and present my contributions to the Flyspeck project.
