Ignition timing (or spark timing) controls when the spark plug fires during the Compression Stroke. Ignition timing is measured in degrees of crankshaft rotation, before top dead center (BTDC). In a perfect world, The spark plug fires. The flame travels through the combustion chamber, igniting the air/fuel mixture.

What is ignition timing?

Ignition timing is when the distributor sends an electric spark into the engine to ignite the fuel. This fuel ignition is what powers the car. The sequence in which this happens is very finely balanced, or "tuned," to provide maximum power and economy. When he timing is not set properly the car may experience ...

Less ignition timing is needed for higher power ignition systems. For a blown alcohol engine with an old 2 primary ampere magneto, 38 degrees of timing was common. With a higher power magneto near 4 primary amperes, 36 degrees of timing is common. With a very powerful 44 primary ampere magneto, only 22 degrees of timing is common.
