A radial basis function is a real-valued function  $\varphi$  whose value depends only on the distance between the input and some fixed point, either the origin, so that  $\varphi = \varphi$ , or some other fixed point  $\mathbf{c}$ , called a center, so that  $\varphi = \varphi$ . Any

RBF interpolation is a mesh-free method, meaning the nodes need not lie on a structured grid, and does not require the formation of a mesh. It is often spectrally accurate and stable for

The idea of Radial Basis Function (RBF) Networks derives from the theory of function approximation. We have already seen how Multi-Layer Perceptron (MLP) networks with a hidden layer of sigmoidal units can learn to approximate functions. RBF Networks take a slightly different approach.
