During network analysis, we have to transform either delta to star or star to delta for simplifying the network. Let us consider one three terminal network formed by three impedances $Z \ a$, $Z \ b$, and $Z \ c$ connected in star. Consider another three terminal network formed by three impedances $Z \ ab$, $Z \ bc$, and $Z \ ca$. If these two networks are equivalent to each other then the relationship between the impedances of star and delta would be as follows.

When doing circuit analysis, you need to know some essential laws, electrical quantities, relationships, and theorems. Ohm's law is a key device equation that relates current, voltage, and resistance. Using Kirchoff's laws, you can simplify a network of resistors using a single equivalent resistor. You can also do the same type of calculation to obtain [...]

Consider that infinite asymmetrical networks having identical electrical properties are connected in cascade as shown in the Fig. 8.4 (a) and (b). The iterative impedance is the impedance measured at one pair of terminals of the network in the chain of infinite networks as shown in the Fig. 8.4 (a) and (b).

The analysis of unsymmetrical faults in power systems is carried out by finding the symmetrical components of the unbalanced currents. Since each sequence current causes a voltage drop of that sequence only, each sequence current can be considered to flow in an independent network composed of impedances to current of that sequence only.
