Quantum Kinetic Equation And Universal Conductance

Quantum potential as part of the Schrödinger equation. The Schrödinger equation $\partial \partial = (-\nabla +)$ is re-written using the polar form for the wave function $= (/)$ with real-valued functions and , where is the amplitude (absolute value) of the wave function , and / its phase. This yields two equations: from the imaginary and real part of the Schrödinger equation follow the continuity ...

Modeling Energy Transfer in Quantum Thermal Machines

The Boltzmann equation or Boltzmann transport equation (BTE) describes the statistical behaviour of a thermodynamic system not in a state of equilibrium, devised by Ludwig Boltzmann in 1872. The classic example of such a system is a fluid with temperature gradients in space causing heat to flow from hotter regions to colder ones, by the random but biased transport of the particles making up ...
